

ABSTRACT

A roof rack for a sport utility vehicle. The rack includes a main frame attached to the vehicle and a plurality of rack portions or cross pieces pivotally mounted to the main frame. In use, the rack portions with the gear or carrying trays supported on them can be pivoted to one side of the vehicle and out of the path of the normal movement of the vehicle top including any sunroof. The top or sun roof can then be easily and quickly moved as intended between its open and closed positions without having to unload and reload the stored gear or other items.
